Profile

Senior Product Engineer with 10+ years shipping end-to-end across the full stack in B2B SaaS. Built an AI evaluation infrastructure at Intercom for Fin AI, adopted by over half of all active customer companies. Redesigned investment data pipelines at Smart Pension, cutting processing time from 4 hours to 15 minutes. Scaled energy optimisation systems serving 10,000+ commercial buildings at Arbnco. Works best at the intersection of product and engineering, turning ambiguous problems into shipped features with measurable customer impact.

Work Experience

Intercom (intercom.com) – AI/Customer Support – London

Product Engineer III

Feb 2025 – Aug 2025

Worked on Intercom's AI Agent team, building evaluation and testing infrastructure for Fin AI across Ruby on Rails, TypeScript/React, and Python.

- Shipped Fin AI Test Page, a golden dataset evaluation tool adopted by 50%+ of active customer companies to validate AI responses against real questions before release.
- Launched Impersonation to open beta, enabling thousands of customers to simulate realistic Fin conversations across user segments, regions, languages, and audience rules before go-live.
- Delivered Live end-to-end testing on customers' own websites, including cross-window authentication to enable secure, production-like conversation testing.
- Improved reliability for millions of end users by identifying and resolving four critical production bugs in Messenger, reducing customer-reported incidents.

Smart (smartpension.co.uk) – Pensions/Finance – London

Senior Software Engineer

Sep 2022 – May 2024

- Redesigned the investment data pipeline from sequential hourly batch jobs to parallel processing using Sidekiq Batches with idempotent operations, reducing end-to-end processing from 4 hours to 15 minutes.
- Owned the Holdings domain in Ruby on Rails as the system of record for customer asset holdings, publishing and consuming domain events via Kafka, and leading technical decisions within a team of 10 engineers.
- Designed and delivered a real-time funds calculation service used platform-wide to validate whether transactions could proceed, serving as the source of truth for millions of pension transactions.
- Implemented Datadog observability and monitoring across AWS services, improving incident detection and production reliability for the Holdings domain.
- Achieved 99.2% test coverage across the Holdings API through strict TDD practices, enabling confident deployments and near-zero production regressions.
- Conducted 10+ technical interviews for backend engineering roles, contributing to the team's hiring pipeline.

Arbnco (arbnco.co.uk) – Glasgow

Lead Engineer

Jun 2018 – Sep 2021

- Built energy optimisation systems serving 10,000+ commercial buildings across the US, integrating 5 third-party energy APIs to collect, process, and analyse building performance data.
- Designed and delivered financial projection reports showing clients potential savings of hundreds of thousands of dollars over 3-5 years, including payback period calculations for each recommended upgrade.
- Led the migration from Heroku to Kubernetes, reducing infrastructure costs by 75% across all project environments.
- Delivered core platform services in Ruby on Rails and led GraphQL adoption across 3 major projects, reducing API complexity and improving frontend delivery speed.

- Built Python/FastAPI APIs to integrate with AI and machine learning services, handling inference requests and data processing for the company's intelligent building analytics.
- Hired 5 engineers and led delivery across 4 concurrent projects, setting technical standards and architecture direction.
- Introduced the Shape Up methodology with 2-week delivery cycles, mentoring engineers on TDD and CI/CD and establishing consistent practices across all teams.

IASD / Medical Residency Exam Platform – Remote (Brazil)

Co-founder & Lead Engineer

2021 – 2022

- Built and launched a full-stack medical residency exam platform serving 6,000+ paying doctors, using Elixir, Phoenix, and LiveView.
- Implemented secure payment processing (PagBank) and end-to-end encryption across the full selection pipeline: registration, randomised exam delivery, automated scoring and ranking, bulk notifications, and results publication with reporting dashboards.
- Owned the full product lifecycle from architecture to production infrastructure on AWS (EC2, S3), including an admin portal for exam lifecycle management.

Current Projects

Agendar - AI Scheduling Platform

<https://agendarconsultas.com/>

- An AI-powered healthcare scheduling platform where patients book appointments through natural language conversations on WhatsApp.
- Designed a multi-stage RAG pipeline combining vector search (pgvector) and lexical search with contextual re-ranking for sub-second knowledge retrieval.
- Designed event-driven architecture for LLM tool-calling, handling booking, rescheduling, and cancellation with deterministic guardrails and circuit breakers.
- Stack: Elixir, Phoenix, LangChain, GraphQL, React, Apollo, PostgreSQL/pgvector, OpenAI

Tasker - AI Project Management Platform

<https://mytasker.app>

- Built a Linear-style task manager with an AI assistant for conversational operations and autonomous actions.
- Implemented function calling + RAG (pgvector) hybrid architecture for semantic retrieval, task creation, and team messaging.
- Stack: Rails 8, GraphQL, React, Apollo Client, PostgreSQL, Claude Sonnet

Skills

Core Languages: Ruby, TypeScript, Python, Node.js, Go

Frameworks: Ruby on Rails, React, Next.js, FastAPI, NestJS, Express.js

Data & Infra: PostgreSQL, MySQL, Kafka, AWS, Docker, Kubernetes, CI/CD, Datadog

APIs & Architecture: System Design, GraphQL, REST APIs, WebSockets, Event-Driven Architecture, Microservices

AI: LLM Integration (Claude/GPT), RAG, Semantic Search, Prompt Engineering, AI evaluation workflows

Education

Bachelor of Science in Computer Science, Federal University of Piauí (UFPI)

Aug 2009 – Jan 2014
